

Power-BI-Analysis-Report

Page 1: Executive Sales & Performance Overview

Objective:

Designed a high-level executive dashboard to provide real-time visibility into the E-Commerce platform's financial health and sales momentum. The focus was on establishing a baseline for revenue tracking and identifying temporal trends.

Key Implementations:

KPI Tracking: Implemented dynamic Card Visuals to display headline metrics: Total Revenue, Total Orders, Total Customers, and Average Order Value (AOV). These metrics update automatically based on the selected date range.

Temporal Trend Analysis: Developed a Line Chart to visualize the Monthly Sales Trend from 2016 to 2018. This visualization was critical in identifying seasonality, specifically revealing a massive 12,000% growth spike during the November Black Friday period.

Interactive Filtering: Integrated a Date Slicer (Between function) to allow stakeholders to filter data for specific quarters or years, enabling granular historical analysis.

Data Accuracy: Applied filters to exclude 'Canceled' and 'Unavailable' orders to ensure revenue calculations reflected only realized sales.

Page 2: Customer Demographics & Geographic Analysis

Objective:

Performed a geospatial and demographic analysis to understand the customer base distribution and their payment preferences. This page answers "Where" the demand is coming from and "How" customers are paying.

Key Implementations:

Geospatial Visualization: Utilized a Map Visualization to plot customer locations using Latitude and Longitude data. This highlighted the high concentration of demand in the Southeast region compared to the North.

Regional Breakdown: Created a Clustered Bar Chart to rank the Top 10 States by Customer Count. The analysis confirmed that Sao Paulo (SP) and Rio de Janeiro (RJ) account for the majority of orders.

Payment Behavior Analysis: Designed a Donut Chart to visualize the distribution of Payment Methods. The analysis revealed that Credit Cards are the dominant payment mode (73%), followed by Boleto.

Installment Logic: Added a specific visual to track Installment Payments, uncovering that 90% of credit card transactions are paid in installments, indicating a credit-driven consumer behavior.

Page 3: Product Performance & Operational Efficiency

Objective:

Focused on the operational side of the business, analyzing product category performance, seller contribution, and logistics efficiency (Delivery Time).

Key Implementations:

Category Ranking: Developed a Bar Chart to identify the Top 10 Product Categories by Revenue. This visual identified 'Bed_Bath_Table' and 'Health_Beauty' as the primary revenue drivers.

Delivery Time Analysis: Calculated a custom measure for Average Delivery Days (Order Purchase Timestamp vs. Order Delivered Customer Date). This metric was visualized against different States to identify regions with logistics bottlenecks.

Seller Performance: Created a Table Visual to rank sellers based on total revenue generated. This helped in identifying "Power Sellers" who contribute disproportionately to the platform's GMV (Gross Merchandise Value).

Pareto Analysis: The data layout was structured to highlight that a small percentage of categories and sellers drive the majority of the revenue, validating the Pareto Principle (80/20 rule) in this dataset.
