

# **OLA Ride Analytics - Executive Summary Report**

Prepared By: Uttam Tiwari (Data Analyst | BCA)

Project Type: End-to-End Data Pipeline (SQL + Power BI)

## **1. Project Objective**

The primary objective of this project was to clean and transform the raw OLA dataset using SQL and develop an interactive dashboard in Power BI. This dashboard provides actionable business insights regarding ride volume, revenue generation, cancellation rates, and user ratings to measure overall business performance.

## **2. Overall Business Performance (Key Metrics)**

The business flow remained strong, with a success rate of over 60% for all initiated rides.

Total Bookings: 40,539

Successful Bookings: 25,207

Total Booking Value (Revenue): 13.76 Million

## **3. Revenue & Payment Insights**

The financial analysis indicates a strong customer reliance on both cash and digital payment methods.

Top Payment Method: Cash transactions generated the highest revenue, contributing 7.5M.

Second Best Method: UPI transactions accounted for 5.6M, showcasing significant digital adoption.

Daily Trend: Ride volume and revenue experienced consistent fluctuations throughout the month, which have been accurately visualized in the day-by-day trend analysis.

## **4. Vehicle Type Performance**

Customers are utilizing all vehicle categories relatively evenly, indicating a well-balanced fleet.

Prime Sedan, Prime SUV, Bike, and E-Bike all generated strong revenue ranging between 3.08M and 3.28M. This demonstrates that every OLA vehicle category is performing well in the market.

## **5. Cancellation Analysis (Critical Insight)**

As a Data Analyst, the primary focus was to identify operational bottlenecks.

Total Cancelled Rides: 11,291

Cancellation Rate: 27.9%

Major Reasons: The visual analysis reveals that cancellations stem from both drivers and customers (e.g., 'Driver asked to cancel' or 'Customer changed plans'). Tracking these specific reasons allows the operations team to address and fix core issues.

## **6. Customer & Driver Ratings**

Service quality remains highly stable across the platform.

The average ratings for both customers and drivers across Prime Sedan, SUV, Mini, and Bikes are consistently maintained between 3.9 and 4.0.

## **7. Conclusion & Value Added**

This end-to-end project successfully transformed raw, unorganized data into a structured format for critical decision-making. By leveraging advanced DAX calculations (CALCULATE, DIVIDE) and SQL data modeling, this report provides the operations team with a clear view of strong revenue drivers and specific areas requiring operational improvement to reduce cancellations.
